

This scold-down compost bin has most of the advantages of the Esporta design. Its stability and strength come from the sturdy base. The fiberglass roof is light enough to lift easily.

A picket-fence pen.

AN ELABORATE TWO-BIN COMPOST CONTAINER made of wood and concrete blocks which are held in place with mortar. The blocks are set on edge with the holes open so that gases such as oxygen and carbon dioxide can pass freely in and out of the compost. The north side of the pile is protected from the cold wind by hardwood boards which slide in and out of their vertical tracks to allow easy access to the piles (see details).

Soiling our hands since 1971

AN ALTERNATIVE COMPOSTING SYSTEM — much like a mini-french silo — modeled after the open concrete areas used for storing silage on large livestock farms. This is a good way to get around having to turn your compost by hand, and a great way to put your rotary tilter to good use at times when you are not able to use it in the garden. The distance between the plywood sidewalls should be just a little greater than the width of the tiler. Pile organic matter in the open-ended container — making the pile highest in the center and tapering it gradually toward either end. As you drive your machine through, the tilters should mix and turn the material for you.

Snow fence makes strong but light bins that look good. To turn compost, take down the bin, then set it up again a few feet away and turn the compost into it.

Walden wheelbarrow can be converted to use as a tabletop shredder.
